# Objetivos desta apresentação

Apresentação de conclusão da segunda etapa do trabalho

## O que foi feito

- Lexer adaptado para Imp-1
- Parser para Imp-1
- Pi Framework: implementado compilador com ambientes e declarações (variáveis e constantes)
- Print()
- Refatoração do código: limpeza visual

## O que foi feito: Lexer

```
case INITIALIZER ("=", { _ in ImpToken.INITIALIZER }),
case REFERENCE(String) ("(&\\(\\*)", { (m: String) in ImpToken.REFERENCE(m) }),
case LET
case IN
case DECLARATION(String)
case PRINT
("(?![0-9])[a-zA-Z_][a-zA-Z_0-9]*", { (m: String) in matchName(string: m) }),
```

Figura 1: enum que define os tokens para Imp-1 - imp token processor

## O que foi feito: Lexer

```
else if string == "let"
       return ImpToken.LET
else if string == "var" || string == "cons"
       return ImpToken.DECLARATION(string)
else if string == "in"
       return ImpToken.IN
else if string == "print"
       return ImpToken.PRINT
else
       return ImpToken.IDENTIFIER(string)
```

Figura 2: função matchName

```
/// - This wrap the reference operations(<reference>).
public protocol ReferenceImpNode: ExpressionImpNode
       var identifier: IdentifierImpNode { get }
/// - This wrap the address reference operation(<address reference>).
public struct AddressReferenceImpNode: ReferenceImpNode
       public let identifier: IdentifierImpNode
       public var description: String
                return "AddressReferenceNode(\(identifier))"
/// - This wrap the value reference operation(<value_reference>).
public struct ValueReferenceImpNode: ReferenceImpNode, LogicalExpressionImpNode, ArithmeticExpressionImpNode
       public let identifier: IdentifierImpNode
       public var description: String
                return "ValueReferenceNode(\(identifier))"
```

Figura 3: estrutura do nó imp - Reference

```
/// - Helper function for dealing with the REFERENCE imp token processing(<reference>).
/// - Return
    - The relative reference imp node to the given token.
private func parseReference () throws -> ExpressionImpNode
        guard case let ImpToken.REFERENCE(op) = tokens.pop() else
               throw ParserError.ExpectedToken("ImpToken.REFERENCE")
        let identifier: IdentifierImpNode = try parseIdentifier()
        switch(op)
                case "&":
                        return AddressReferenceImpNode(identifier: identifier)
                case "(*":
                        guard case ImpToken.BRACKET RIGHT = tokens.pop() else
                                throw ParserError.ExpectedToken("ImpToken.BRACKET RIGHT")
                        return ValueReferenceImpNode(identifier: identifier)
                default:
                        throw ImpParserError.UndefinedOperator(op)
```

**Figura 4:** processamento de Reference token com retorno do nó imp específico

```
/// - This wrap the variable node(<variable declaration>).
public struct VariableDeclarationImpNode: DeclarationImpNode
       let identifier: IdentifierImpNode
       let expression: ExpressionImpNode
       public var description: String
               return "VariableNode(\(identifier), \(expression))"
/// - This wrap the constant node(<constant declaration>).
public struct ConstantDeclarationImpNode: DeclarationImpNode
       let identifier: IdentifierImpNode
       let expression: ExpressionImpNode
       public var description: String
               return "ConstantNode(\(identifier), \(expression))"
```

Figura 5: estrutura do nó imp - Declaration

```
/// - Helper function for dealing with the DECLARATION imp token processing(<declaration>).
       Also here all its ramifications will be processed(<variable declaration>, <constant declaration>))
/// - Return
       - The relative declaration imp node to the given token.
private func parseDeclaration () throws -> DeclarationImpNode
       guard case let ImpToken.DECLARATION(op) = tokens.pop() else
               throw ParserError.ExpectedToken("ImpToken.DECLARATION")
        let identifier: IdentifierImpNode = try parseIdentifier()
        guard case ImpToken.INITIALIZER = tokens.pop() else
               throw ParserError.ExpectedToken("ImpToken.INITIALIZER")
        let expression: ExpressionImpNode = try parseExpression()
       switch(op)
               case "var":
                        return VariableDeclarationImpNode(identifier: identifier, expression: expression)
                case "cons":
                        return ConstantDeclarationImpNode(identifier: identifier, expression: expression)
                default:
                        throw ImpParserError.UndefinedOperator(op)
```

**Figura 6:** processamento de Declaration token com retorno do nó imp específico

```
public struct BlockImpNode: CommandImpNode
        let declaration: [DeclarationImpNode]
        let command: [CommandImpNode]
        public var description: String
                return "BlockNode([\(declaration) - \(declaration.count)], [\(command) - \(command.count)])"
/// - This wrap the print operation(<print>).
public struct PrintImpNode: CommandImpNode
        let expression: ExpressionImpNode
        public var description: String
                return "PrintNode(\(expression))"
```

Figura 7: estrutura do nó imp - Block e Print

```
/// - Helper function for dealing with the PRINT imp token processing(<print>).
/// - Return
/// - The relative print imp node to the given token.
private func parsePrint () throws -> PrintImpNode
       guard case ImpToken.PRINT = tokens.pop() else
                throw ParserError, ExpectedToken("ImpToken, PRINT")
       guard case ImpToken.BRACKET_LEFT = tokens.pop() else
                throw ParserError.ExpectedToken("ImpToken.BRACKET_LEFT")
       let expression: ExpressionImpNode = try parseExpression()
       guard case ImpToken.BRACKET_RIGHT = tokens.pop() else
                throw ParserError.ExpectedToken("ImpToken.BRACKET_RIGHT")
       return PrintImpNode(expression: expression)
```

Figura 8: processamento de Print token

```
/// - Helper function for dealing with the BLOCK imp token processing(<block>).
/// - Return
       - The relative block imp node to the given token.
private func parseBlock () throws -> BlockImpNode
        guard case ImpToken.LET = tokens.pop() else
                throw ParserError, ExpectedToken("ImpToken, LET")
        var declarationForest: [DeclarationImpNode] = [DeclarationImpNode]()
        while(true)
                let declaration: DeclarationImpNode = try parseDeclaration()
                declarationForest.append(declaration)
                if (tokens.isEmptv())
                        throw ParserError.ExpectedToken("ImpToken.IN")
                else if case ImpToken.IN = tokens.peek()
                        tokens.skip()
                        break
                else if case ImpToken.COMMA = tokens.peek()
                        tokens.skip()
```

Figura 9: processamento de Block token

```
var commandForest: [CommandImpNode] = [CommandImpNode]()
while true
       let command: CommandImpNode = try parseGrammar()
        commandForest.append(command)
       if tokens.isEmpty()
                throw ParserError.ExpectedToken("ImpToken.END")
        else if case ImpToken.END = tokens.peek()
                tokens.skip()
                break
return BlockImpNode(declaration: declarationForest, command: commandForest)
```

Figura 10: continuação... processamento de Block token

# O que foi feito: Pi Framework

• Vamos ao código...

## O que não foi feito e porquê

• Código completamente documentado

## Avaliação da evolução do trabalho

• Here we go to Imp-2!
